# **SOFTWARE REQUIREMENT** **SPECIFICATION**

## **1. AIM**

We aim to define a model for the efficient fleet management and service maintenance of the vehicles, spare parts inventory, and supplier's records management. We hope to successfully complete the project with the cooperation of our group members. By doing this project we hope to obtain valuable knowledge for the foreseeable future.

## **2. SCOPE**

The fleet management system is used for monitoring different kinds of motor vehicles such as cars, vans, trucks, aircraft, ships as well as rail cars. It has numerous applications such as vehicle maintenance, vehicle tracking, and diagnostics, improving driver performance, speed control, repair, routing, employees, location, drivers, and fuel management.

Fleet management is a complex and largely data-driven process that requires involvement in every part of a company's fleet. A successful fleet management program will track, analyze, and work to optimize every aspect of the fleet, which encompasses hiring and training drivers, acquiring vehicles, tracking the fleet, regulating maintenance and safety protocols, mitigating risk, and preparing for all operation situations.

## **3. PURPOSE**

The objective of Fleet Management in business is to ensure the work vehicles of business are operating smoothly, are constantly seeking ways to improve performance, are able to keep operating costs at a minimum, and maintain compliance with government regulations. Fleet Management System is the range of functions that allows transportation companies in business to minimize the risk related to improving efficiency, proven return on investment, productivity in business and reducing the overall cost.

It is a modular-based system that has been developed for the group of transportation or large companies using fleets/vehicles with the sole intention of operating the business in a timely manner and reliable way.

Fleet management includes a range of functions like tracking valuable assets; automating the fleet reports, Management of vehicles and security & control of the fleet.

Using dedicated software for managing fleet brings multiple benefits to the table:

- automates tasks (e.g. proper routing)
- streamlines associated processes (e.g. Vehicle maintenance)
- provides real-time insights for better management of both drivers and vehicles
- connects vehicles
- ensures smart transportation
- enhances driver safety
- guarantees consistent fleet performance
- reduces costs

#### **4. PERSPECTIVE**

The super users of the system are the 'ADMIN' and the 'MANAGERS' of the different departments allocated by the admin. The admin may be the owner of the transportation organization or the manager of the transportation department of a particular manufacturing company. If any other vehicle is added to the fleet which already exists for the organization/department the details of the vehicle are added. The details include whether it is a new one or taken out of any loan/lease. Any employee is newly appointed or the existing employee is taken off both the details are maintained including their personal details and professional details. The details of the maintenance that are being performed such as repairs/services and to be performed are also maintained.

The maintenance to be performed can also be scheduled for each type of vehicle. The details of the parts/inventory used for the vehicles are maintained. The reorder level and the reorder quantity are predefined for each particular type of part. The Vendors or suppliers of the vehicles, parts and performs the maintenance required for the vehicles. The particulars of the various vendors are maintained in this system. Examples of large business fleets include Rental car/truck companies, Moving companies, Taxi companies, Delivery companies, Long haul semi-truck companies.

#### **5. USER CHARACTERISTICS**

1. Administrators and authorized personals Module
2. User Module
3. Tracking Module

4. Help Module
5. Health Module

#### Administrators and authorized personals Module

A list of authorized personnel will be granted permission to access the management side of the fleet. No one can register as admin after the accounts are created until the code is altered to ensure security. The admin account has all the privileges, to check about any particular vehicle (fleet) or customer, to block any account, to update the status about health and generate alerts, to calculate the payment, making changes into accounts of users, maintain a list of all the customers and the spare part inventory status, etc.

#### User Module

After the user has registered and logged in, then the features provided can be used by the user. If the user is a customer then he can see all the available fleet could be taken on rent. There are two users that are present here in this system. One is admin but the other is a user. This user has all the privileges but it cannot register itself on this system as the admin needs to verify the registering user. After the admin verifies the user only when he is eligible to use the system.

#### Tracking Module

Vehicle tracking systems are commonly used by fleet operators for fleet management functions such as fleet tracking, routing, dispatching, on-board information, and security. Some vehicle tracking systems are bundled with or interface with fleet management software. Along with commercial fleet operators, urban transit agencies use the technology for a number of purposes, including monitoring schedule adherence of buses in service, triggering automatic changes of buses' destination sign displays once the vehicle approaches the bus terminus (or other set location along a bus route such as a particular bus stop along the route), and triggering pre-recorded (or even synthetic speech) bus stop, route (and its destination) or service announcements for passengers.

#### Help Module

This module gives the customers/ users the privilege to contact nearby towing, roadside assistance, and car health check-up (according to the parameters mentioned earlier) facilities, in case of any emergency situation. In this case, the customers are made aware of the nearby service stations.

#### Health Module

Our fleet car safety module includes workplace health and safety videos on topics including braking, vehicle speed, distractions for drivers, drug and alcohol awareness, manual handling, pre-operational checks, and more.

## 6. SOFTWARE REQUIREMENTS:

Frontend - HTML, CSS, Javascript, Python3

Backend - Django

Database - Sqlite3

Processor - Ubuntu as an operating system.

**Database:** Obtaining databases from, The merchants who have sold the vehicles to the fleet, the data from the spare parts inventory, the list of managers and authorized personals who will be granted the permission and list of customers who are currently using the fleet for required work.

**Mapping Systems:** This is the main software component of the Fleet management system. This whole system is dependent on the web mapping of the data or information that the GPS devices provide. Google maps could be used as the tool which displays geographical information on a map which is the most accepted form as digital data.

## 7. HARDWARE REQUIREMENTS:

**Mobile Phones:** Any Mobile phone with the driver with GPS enabled in it can be used for the real time tracking of the vehicle and the driver. This provides us with the location access to any of the fleet.

**GPS Device:** Connectivity to GSM/GPRS models fixed on the vehicles. Live GPS tracking devices are ideal for most vehicle tracking needs. With live GPS tracking systems in the fleet, you can have access to real-time data about vehicle location, use, driving speed, etc. This can be used to track driving habits, route vehicles more effectively, keep tabs on equipment that is at high risk of theft or emergency situation.

**Web browser:** Internet Explorer 5.0 and above.

**Socket connection:** One of the main software components of the Fleet management system is a socket communication server. It is a central server component that communicates with the tracking units. Socket connection is capable of communicating with multiple clients units using multiple threads as it establishes TCP/IP socket connection with the remote hardware units. When the fleet GPS is connected, the server will authenticate the connection and proceed to receive information from the device.

## **8. FUNCTIONAL REQUIREMENTS**

### **MANAGING VEHICLES:**

We will provide you all the information regarding the fleet/vehicles in the web portal's dashboard-like vehicles insurance details, vehicle renewable reminders and Maintenance/service reminders for vehicles, etc. Our system provides automated reports for every penny you spent on the vehicle and each expense you are going to do in the meantime. We provide a vehicle orders bar where you can manage orders and get previous order details.

### **GPS TRACKING:**

The tracking unit collects the location information with the help of the GPS (Global Positioning System) device which we used in our system as hardware. Global Positioning System can be used for providing the route to the fleet. GPS formats collect information into the system-specific packet format and send it to the server via socket connection server. Global Positioning System tracking system uses the Global Navigation Satellite System (GNSS) network. This network incorporates a range of satellites that use microwave signals that are transmitted to GPS devices to give information on location, vehicle speed, time and direction by which we can manage Real time tracking of the fleet which includes vehicle tracking, driver detail and asset details and Fleet scheduling management for on-time deliveries and customer services.

### **SPEED TRACKING:**

Driving with excessive speed is one of the main factors in fatal road accidents. Driving at a safe speed can help save lives. Fleet managers have an interest in keeping their drivers on the road and out of the troubles, and they also want to ensure that their fleet is operating in an efficient and timely manner. Speed tracking and reporting is a principal feature in the Fleet Management System. In terms of reporting, our systems will report all offenses to base in real time (even have the capacity to set an SMS alert)

### **GEOFENCE:**

Geofence is described as the circular areas which are defined around a particular location. It is set by the client in the Fleet Management system by being able to define the radius of the area. The GPS location of the center of the circle and the radius define a Geo-fence. If a vehicles GPS location is within the Geofence, then they are in safe area and if any vehicle go outside the area of geofence the client is notified by a text or email alert and the event is recorded

### **AUTOMATE THE FLEET REPORT:**

We surely provide the automated report on each transaction or order. We provide automated reports of the previous orders of the fleet which you can check at any time or download the file.

## 9. NON-FUNCTIONAL REQUIREMENTS:

**Server:** We can use any server for this management system but we prefer these two servers to be precise that we will be working on:

NGINX Server – Nginx is an open-source web server that can handle a website with a huge amount of traffic. It is a high-performance web server developed with an intention to handle websites with a large number of users. Its specialty is that it can run on a minimal amount of resources and handle a large number of requests.

Digital Ocean Server – Digital ocean server or ‘droplets’ is a cloud server that is designed to store and server a massive amount of data while making it easy and cost-effective. Digital ocean server uses KVM as a hypervisor and can be created in various sizes. It helps in build deploy and scale cloud application faster and more efficient

**Database:** We will be using any of these two databases for storing the data we collected from the tracking devices of the fleet:

PostGIS/PostgreSQL  
Django Administrator  
MySQL

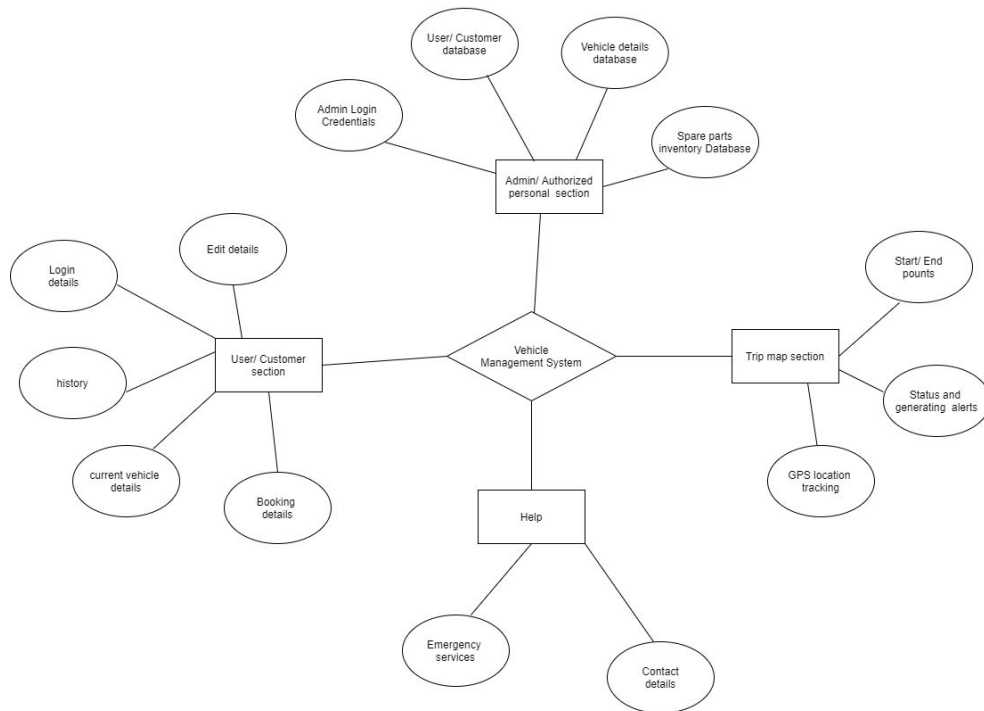

**Mapping Systems:** This is the main software component of the Fleet management system. This whole system is dependent on the web mapping of the data or information that the GPS devices provide. For mapping the data we can use any of these two Mapping systems.

Google Maps: Google Maps is the tool that is used to display geographical information on a map which is in a widely accepted standard format for digital maps.

OSM (Open Street Map): OSM is the software that creates and distributes the open-source graphics data of the world. OSM has no restrictions of the technical or legal type. It allows free access to its map images and underlying map data. Here we can show our tracking data in real time.

Text

# **SOFTWARE DESIGN DOCUMENTATION**

## **1. INTRODUCTION**

This will serve as "objective evidence" that the designers and/or implementers are following through on their commitment to implement the functionality described in the requirements specification. It will be able to adequately serve as training material for new project members, imparting to them enough information and understanding about the project implementation, so that they are able to understand what is being said in design meetings, and won't feel as if they are drowning when they are first asked to create or modify source code.

## **2. DESIGN CONSIDERATIONS**

### **3.1 Assumptions and Dependencies**

For the program to run, the software called XAMPP is used XAMPP is a free and open-source cross-platform web server solution stack package developed by Apache Friends, consisting mainly of the Apache HTTP Server, MariaDB database, and interpreters for scripts written in the PHP and Perl programming languages

Any operating system will work if it supports XAMPP

There end users are expected to have basic computer knowledge

### **3.2 Goals and Guidelines**

The following design principles were used while making the project

- **Open/Closed Principle (OCP)**

This principle states that software entities (classes, modules, functions, etc.) should be open for extension but closed for modification. The "closed" part of the rule states that once a module has been developed and tested, the code should only be changed to correct bugs. The "open" part says that you should be able to extend existing code in order to introduce new functionality.

- **Interface Segregation Principle (ISP)**

This principle states that Clients should not be forced to depend upon interfaces that they don't use. This means the number of members in the interface that is visible to the dependent class should be minimized.

- The KISS principle ("Keep it simple stupid)

This principle states that try to keep each small piece of software simple and unnecessary complexity should be avoided. This helps us to write easy maintainable code.

- DRY (Don't Repeat Yourself)

This principle states that each small pieces of knowledge (code) may only occur exactly once in the entire system. This helps us to write scalable, maintainable and reusable Code.

- Single Responsibility Principle (SRP)

This principle states that there should never be more than one reason for a class to change. This means that you should design your classes in such a way that each class should have a single purpose.

### 3. ARCHITECTURAL STRATEGIES

The strategies adopted during the development process are:

- Relational - Indexing
- Ability to store user history
- User habits to store for analysis
- Minimalistic interface
- Intuitive process flow
- Easy to read results
- Future extension to support web based application

- Modules used in this project are:

Administrators and authorized personals Module

User Module

Tracking Module

Help Module

Health Module

Alert section to display emergency situation of any fleet

- Software Requirements of this project are:
  - **Web application**
    - Frontend - HTML, CSS, Javascript, Python3
    - Backend - Django
    - Database - Sqlite3
    - Processor - Ubuntu as an operating system.
  - **Mobile application**
    - Frontend - Flutter, Android studio
    - Backend - Dart
    - Database - SQFlite Plugin
    - Map services - [google\\_maps\\_flutter](#): ^0.5.11
    - Processor - Android/ IOs as an operating system.
- Hardware Requirements of this project are:
  - Mobile Phones
  - GPS Device
  - Continuous internet connection while using the application
  - Web browser
  - Socket connection

## 5. POLICIES AND TACTICS

To implement software design, we used a variety of strategies that help us define the respective tasks and assist them with the designing process. Here are a few of these strategies we used for designing accurately as well as bug free software products.

Structured Design: This is a conceptualisation of problems into several well organised elements of solutions. It is mainly concerned about the solution design. The biggest advantage of structured design is that it gives a better understanding of how the problem is being solved. Structured design also makes it simpler for the designer to concentrate on the problem more accurately. Additionally, a well-structured design follows some rules for communication among multiple modules, like cohesion and coupling, where cohesion is the grouping of all functionally related elements and coupling is the communication between different modules. In short, a well-structured design has high cohesion and low coupling arrangement.

Function-Oriented Design: This is one of the classical methods of software design, where decomposition centres on identifying the major software function and then elaborating and refining them in a top-down manner. In Function oriented design, the system consists of many smaller sub-systems known as functions. These functions can perform significant tasks in the system. Also, in this the system is considered as the top view of all

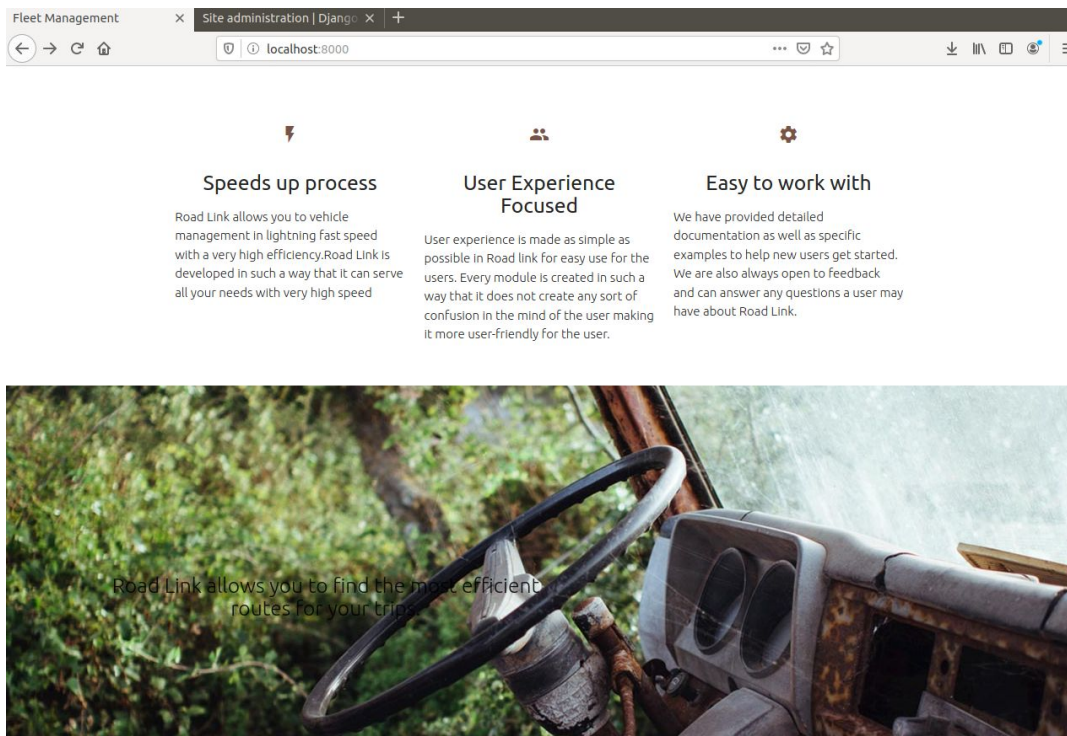

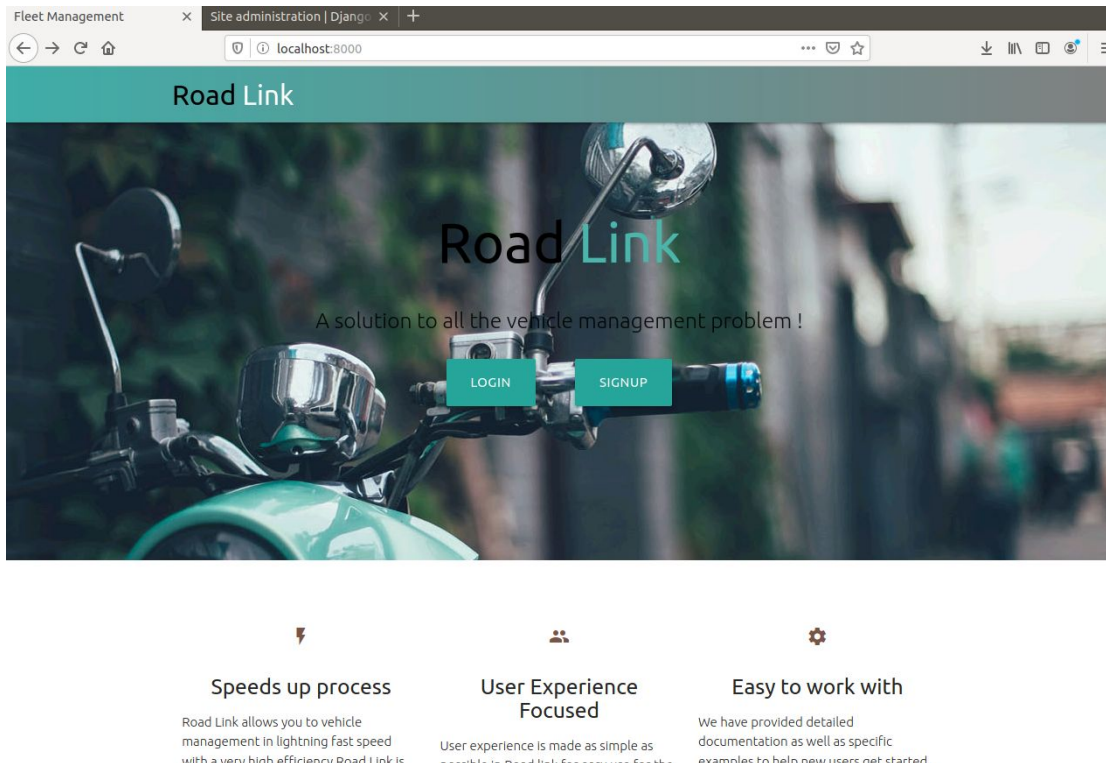

functions. Furthermore, function-oriented design inherits some qualities and properties of Structured Design, where divide and conquer methodology is used. This type of design works well where the system state does not matter, and the program or function works on input rather than on state.

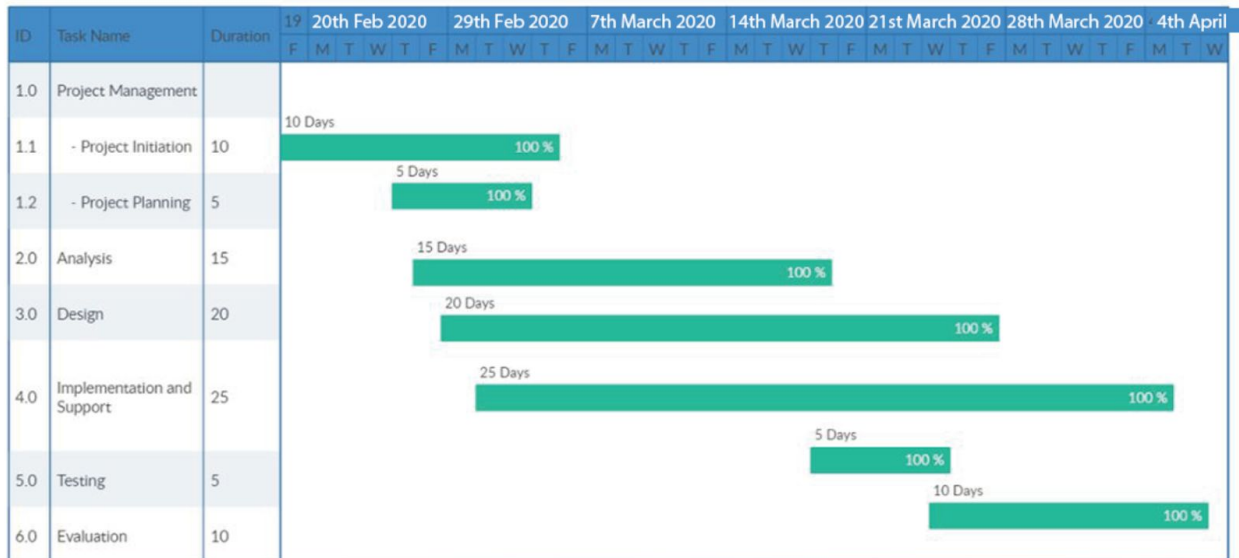

Object-Oriented Design: Object oriented design works with around the entities and characteristics rather than with the function involved in the software system. The whole concept of software solution revolves around the engaged entities.

# IMPLEMENTATION

## 1. Login/Signup

Users can sign up/login to the portal with these pages. It takes in necessary fields required for the user details.

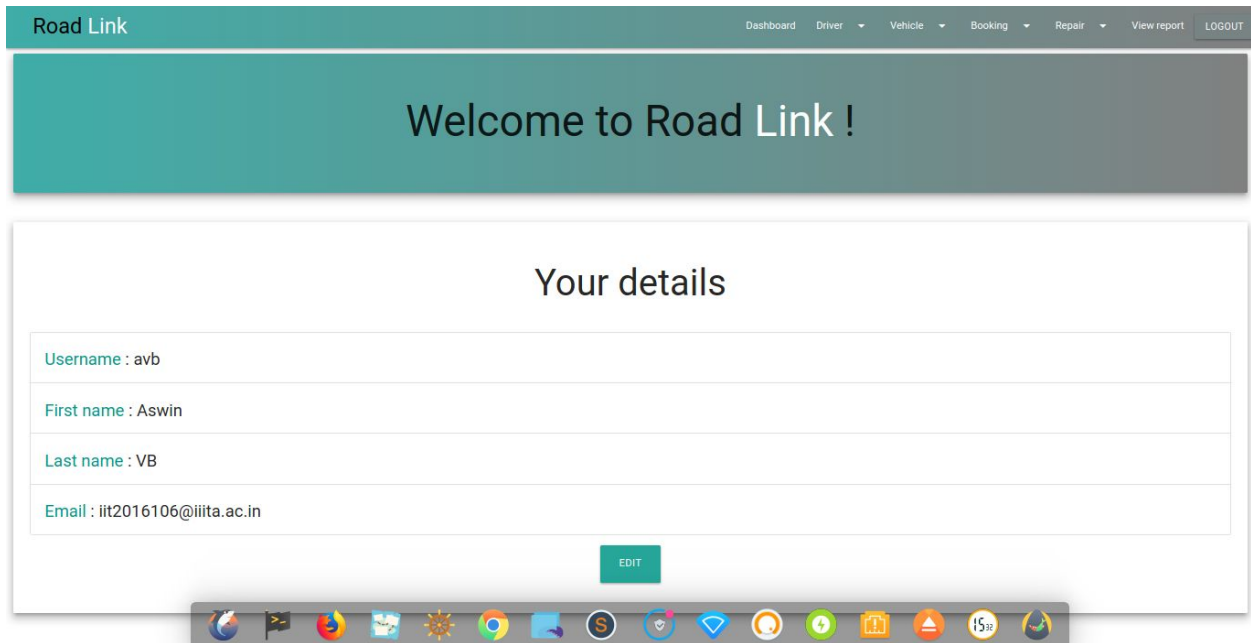

The image displays two screenshots of the A Road Link user interface, set against a solid blue background. Both screenshots feature the 'A Road Link' logo at the top, which consists of a stylized blue 'A' followed by the text 'Road Link' in a blue sans-serif font.

The top screenshot shows the registration (signup) form. It contains four input fields, each with a label above it: 'Username', 'First Name', 'Last Name', and 'Email'. Each field is represented by a horizontal line with a red underline.

The bottom screenshot shows the login form. It contains two input fields: 'Username' and 'Password', each with a horizontal line and a teal underline. Below the password field is a checkbox labeled 'Remember me'. A teal button with the text 'LOGIN' in white is positioned below the checkbox. At the bottom of the form, there are two links: 'Register Now!' and 'Forgot password ?'.

## 2. Dashboard

This is the dashboard in which you can view your details is shown and the user can edit the details.

## 3. Driver

The Driver Section has two pages , one is to add a driver and the other is to view the list of drivers available. This section is only visible for the users which have admin access. The Driver list has the features to search and sort list according to the fields.

## 5. Booking

Booking section has four pages, one is the form to book a trip the second one is the success page where the booking details including the distance, cost, duration is displayed using google maps api. In the success page you have an option to pay which will take you into the payment page.

The screenshot shows the 'Book A Trip' form within the Road Link application. The form is titled 'Book A Trip' and contains several input fields for booking details. The fields are labeled as follows:

- Source: (text input)
- Destination: (text input)
- Startdate: (text input with placeholder 'dd/mm/yyyy')
- Enddate: (text input with placeholder 'dd/mm/yyyy')
- SecurityDeposit: (text input)
- DiscountId: (text input)
- Vehicle: (dropdown menu)

A green 'BOOK' button is located at the bottom right of the form.

The screenshot shows the 'Your booking details' page within the Road Link application. The page displays a table of booking information:

Your booking details	
Name	avb
Source	Kozhikode
Destination	Delhi
Total Distance	2531 Km
Total Duration	1 day 18 hours
Cost	Rs.40496
Vehicle	KLAJ3943
Start Date	Nov. 30, 2018, midnight
End Date	Dec. 16, 2018, midnight
Discount ID	ID12
Status	NB
Booking Date	April 18, 2018, 10:14 a.m.

A green 'PAY RS.40496' button is located at the bottom right of the table.

## 6. Booking - continued

Payment page lets you enter the card details to pay. There is a page to display all the bookings made by the user wherein the user can search for the bookings. The admin will have another option which is to confirm the booking and a driver will be allotted and a mail will be sent to the user saying the mail is confirmed.

## 2.Home Page

This displays the list of operations that can be performed by the authorised admins. They can click on their desired option (fleet health, alerts, tracking, driver details etc.) that takes them to view the respective information.

### 3. View Admins and their details

Admins are identified using an unique Admin ID and the department they work in.

NAME	ADMIN ID	DEPT

#### 4.View Users

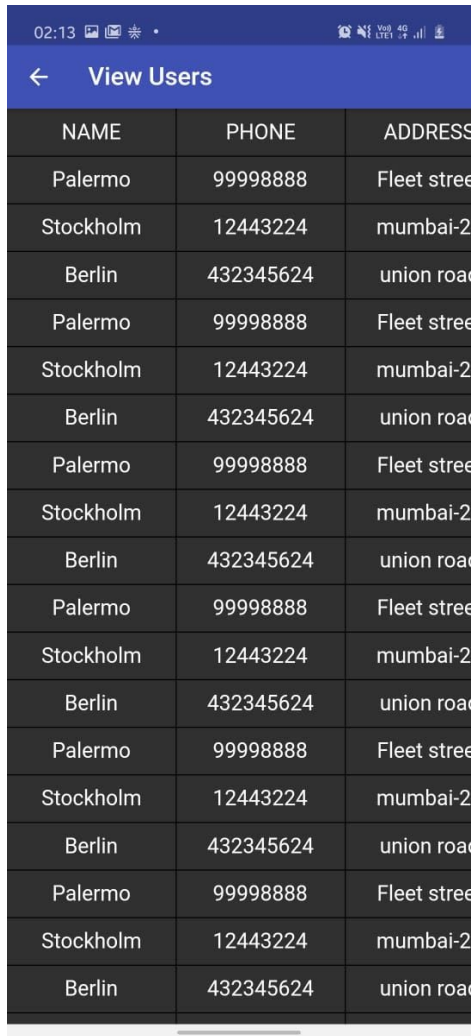

Displays a list of users/customers that book the fleet.

A screenshot of a mobile application interface. At the top, there is a status bar with the time '02:13' and various icons. Below it is a blue header bar with a white back arrow and the text 'View Users'. The main content is a table with three columns: 'NAME', 'PHONE', and 'ADDRESS'. The table contains 18 rows of data, with the first row being the header and the subsequent 17 rows containing user information. The data is repeated in a cycle of three rows: Palermo, Stockholm, and Berlin.

NAME	PHONE	ADDRESS
Palermo	99998888	Fleet street
Stockholm	12443224	mumbai-2
Berlin	432345624	union road
Palermo	99998888	Fleet street
Stockholm	12443224	mumbai-2
Berlin	432345624	union road
Palermo	99998888	Fleet street

## 6. Spare parts availability

The spare parts inventory is the location at which the spare parts for the fleets are stored to ensure their availability at all time this virtual repository stores the count of each part and generates alerts fill the count falls below 100.

By clicking on the order button we allow you to order spare parts from registered forums.

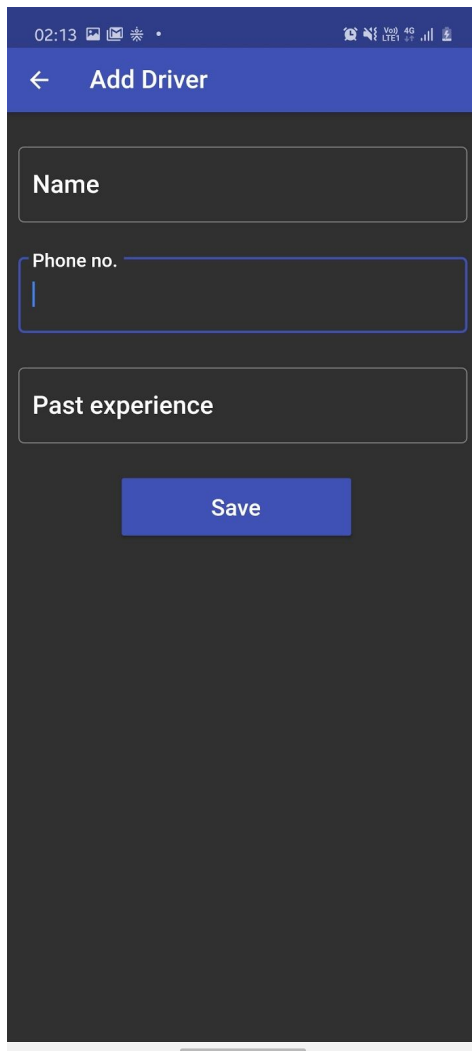

## 7. Driver Details

The drivers registered with our platform are showcased here. After every fleet is completed the customer/users can rate the driver's performance(ratings column).

[illegible]

### 7a. Add Drivers

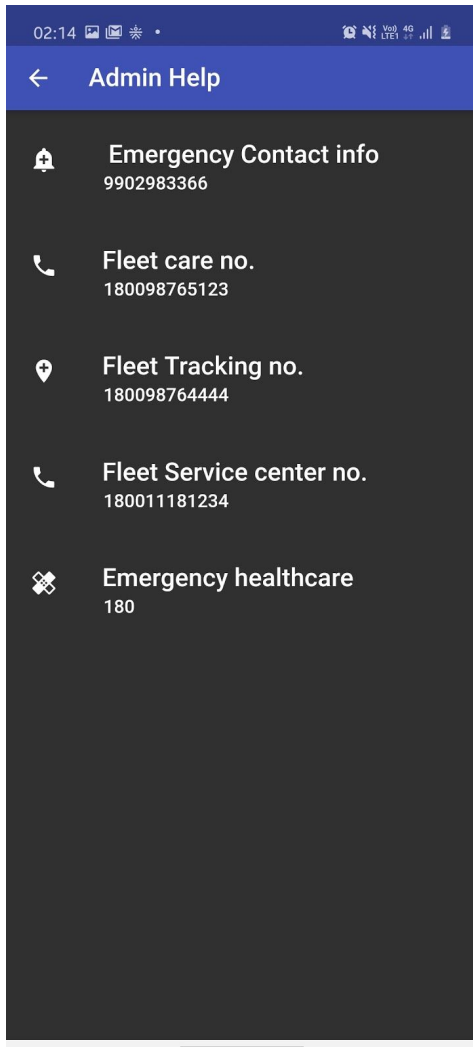

A new driver can be added by the admin by clicking the **add driver floating button** in the bottom right corner of the screen.

The screenshot shows a mobile application interface for adding a driver. At the top, there is a status bar with the time 02:13 and various system icons. Below this is a blue header bar with a back arrow and the text 'Add Driver'. The main content area is dark gray and contains three input fields: 'Name', 'Phone no.', and 'Past experience'. The 'Phone no.' field is currently active, indicated by a blue border and a cursor. At the bottom of the form is a blue 'Save' button.

## 8. RoadSide Assistance

The fleet can avail this feature provided on our application in case it encounters an emergency during its course of service.

## 9. Admin Help

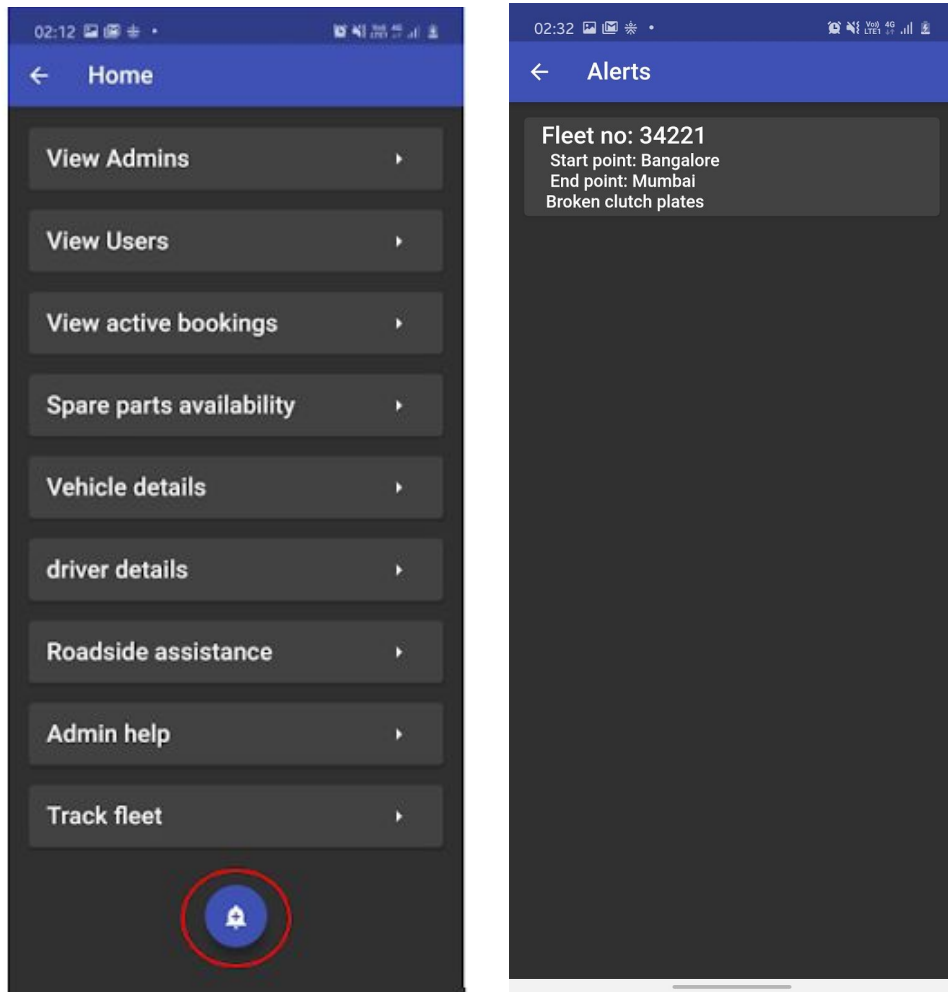

The admin can contact the below services in case of any inconvenience caused on the portal.

## 9. Alerts section

In case any fleet in an emergency situation an alert will be thrown to the admin side so the needful can be done.

Here it displays the Fleet ID, tour details and the reason for generating the alerts.

## 10. Track Fleet

This will display a particular fleet (selected by their respective Fleet ID's).

We have implemented this using google cloud API's and Mapbox, although still under construction.

## 11. GLOSSARY

Entity: An entity, in context to software engineering is an object which is a component of data. A group or collection of entities that are similar to each other can be defined as an entity set. The property of each attribute of the entity can be defined as needed.

Relationship: A relationship, in context to programming is defined as the relation between two entities. Relationships are also designed in order to reduce redundancy of data in the database, this will result in minimizing storage required and faster processing.

DB – Database: A database is used to collect all the information/data required in a systematic manner such that it can be accessed easily. This also makes sure that the data is properly managed, updated and deleted. The database for a particular project will contain all the relevant data required by the project or end users. A database also ensures that data can be stored safe and secure in one place while being easily accessible.

DBMS – Database Management System: Database Management System is a software tool that is used for storing and retrieving users' data. It includes all the features to manipulate the data in the database.

RDBMS – Relational Database Management System: An RDBMS is a subset of a DBMS and is specifically used for relational data.

E-R – Entity-Relationship Model: This is a high level data model that is used to conceptualize the elements or entities in the program. It used to portray the entity and the relationships that exist between these entities for a particular system.
